Motivation Behind My Interest in Research Field

My major influence towards Research has first risen when I started interacting with my faculty who are working on their Ph.D. The way they described their work, challenges to achieve the outcome and their contribution to the society made me interested in this area. Another influence is that learning about the advancements in technology since my higher-studies by reading newspapers and articles. It has developed curiosity and gradually I started reading research papers available on internet. Beyond all this I have a desire to make a difference in this field, I am very keen to pursue the knowledge all that I can. And I think that Research is a good gateway to learn, to explore and to improve. Besides that, I am very much excited to work under a professional and listen to their advices, sharing experiences, exchanging the knowledge.

As a Computer Science Student, I always thought of advancements in technology which turns out to be good for the society. As a student, I've practiced and attempted several tricky problems which helped me to push boundaries of my thinking capacity. I've already faced several challenges in my academics and the output of it is very satisfactory to me. And I believe that this displays my ability in facing the challenges.
